Course: CHM202

Energetics and dynamics of chemical reactions

Assignment - VI

- **Q.1** When a certain liquid freezes at -3.65 °C its density changes from 0.789 gcm⁻³ to 0.801 gcm⁻³. Its enthalpy of fusion is 8.68 kJ mol⁻¹. Calculate the freezing point of the liquid at 100 MPa.
- **Q.2** The partial molar volumes of two liquids A and B in a mixture in which the mole fraction of A is 0.3713 are 188.2 cm³ mol⁻¹ and 176.14 cm³ mol⁻¹, respectively. The molar masses of A and B are 241.1 gmol⁻¹ and 198.2 gmol⁻¹. What is the volume of a solution of mass 1.000 kg?
- Q.3 Consider a container of volume 250 cm³ that is divided into two compartments of equal size. In the left compartment there is argon at 100 kPa and 0 °C while in the right compartment there is neon at the same temperature and pressure. Determine the entropy and Gibbs energy of mixing when the partition is removed. Assume that the gases are perfect.
- **Q.4** At 373.6 K and 372.6 K, the vapor pressure of water is 1.018 and 0.982 atm, respectively. Evaluate the molar entropy of vaporization and ΔV , the change of volume per mole when liquid water vaporises at 373 K. Assume the vapor behaves ideally.
- **Q.5** Heavy water boils at 101.42 °C and its molal elevation constant (K_b) is 10% higher than that of pure water. (a) How does its latent heat compare with that of pure water?, (b) What will be vapor pressure of pure D_2O if its $L_V = 9960Cal. mol^{-1}$?
- **Q.6** An aqueous solution contains 5% by weight of urea and 10% by weight of glucose. What will be its freezing point?
- **Q.7** Blood is said to be isotonic with 0.85% NaCl solution at 40 °C. Assuming complete dissociation of *NaCl*; calculate total concentration of various solutes in blood. What is its approximate freezing point? [Given: Cryoscopic constant $K_f = 1.86$ °C g mol⁻¹].
- **Q.8** A mixture which contains 0.550 gm of camphor and 0.045 gm of an organic solute (containing 93.46% *C* and 0.6.54% *H*) freezes at 157 °C. Find out the molecular formula of the organic compound. [Given freezing point and Cryoscopic constant for camphor are 178.4 and 37.7 °C Kg mol⁻¹, respectively].
- **Q.9** If boiling point of an aqueous solution is 100.1 °C, what is its freezing point? Given l_V and l_V for water are 80 Cal.gm⁻¹ and 540 Cal.gm⁻¹, respectively.
- **Q.10** Chemical potential of O_2 at 300 K is supposed to be 10 kCal. mol⁻¹ at 1 atm. A 1:4 (mole ratio) mixture of O_2 and O_2 is prepared at 1 atm and 300 K. The pressure of the mixture is

increased to 5 atm. Calculate the chemical potential of oxygen in the mixture and in the pure state at 5 atm and $300~\mathrm{K}$.

Q.11 Calculate the change in free energy when 2 moles of H_2 , 3 moles of O_2 and 5 moles of N_2 are mixed at 1 atm, 300 K. Also determine ΔG when the pressure of the mixture is increased to 5 atm. Calculate ΔS_{mix} and ΔH_{mix} .
